1

Thresholding

- Distinct foreground & background needed

Original Threshold = 10

- How do we determine the best threshold?

Based on *A Practical Introduction to Computer Vision with OpenCV* by Kenneth Dawson-Howe © Wiley & Sons Inc. 2014

Slide 3

3

Thresholding

- Binary thresholding
 - for all pixels

$$g(i,j) = 1 \text{ for } f(i,j) \geq T$$

$$= 0 \text{ for } f(i,j) < T$$
 - Simple scenes?
 - LUT
 - for all grey levels

$$LUT(k) = 1 \text{ for } k \geq T$$

$$= 0 \text{ for } k < T$$
 - for all pixels

$$g(i,j) = LUT(f(i,j))$$
 - Objects of interest vs. background

```
threshold(gray_image,binary_image,threshold,
          255,THRESH_BINARY);
```

Slide 2

2

Threshold Detection

- Manual Setting
 - Issue of changing lighting
- Need to determine automatically

- For the techniques which follow:
 - Image – $f(i,j)$
 - Histogram – $h(g)$
 - Probability Distribution – $p(g) = h(g) / \sum_g h(g)$

Slide 4

4

Threshold Detection – Otsu Thresholding

Minimize the spread of the pixels...

- Smallest within class variance

$$\sigma_w^2(T) = w_f(T)\sigma_f^2(T) + w_b(T)\sigma_b^2(T)$$

$$w_f(T) = \sum_{g=T}^{255} p(g) \quad \sigma_f^2(T) = \frac{\sum_{g=T}^{255} p(g) \cdot (g - \mu_f(T))^2}{w_f(T)}$$

$$w_b(T) = \sum_{g=0}^{T-1} p(g) \quad \sigma_b^2(T) = \frac{\sum_{g=0}^{T-1} p(g) \cdot (g - \mu_b(T))^2}{w_b(T)}$$

$$\mu_f(T) = \frac{\sum_{g=T}^{255} p(g) \cdot g}{w_f(T)} \quad \mu_b(T) = \frac{\sum_{g=0}^{T-1} p(g) \cdot g}{w_b(T)}$$

- Largest between class variance

$$\sigma_b^2(T) = w_f(T)w_b(T)(\mu_f(T) - \mu_b(T))^2$$

Slide 5

5

Variations – Adaptive Thresholding

The adaptive thresholding algorithm is

- Divide the image into sub-images,
- Compute thresholds for all sub-images,
- Interpolate thresholds for every point using bilinear interpolation.

OpenCV by Kenneth Dawson-Howe © Wiley & Sons Inc. 2014

Slide 6

6

Variations – Adaptive Thresholding

OpenCV version:

```
if ((f(i,j) - (Σa=-m..m, b=-m..m f(i+a,j+b) / (2m+1)2)) > offset)
    g(i,j) = 255
else g(i,j) = 0
```

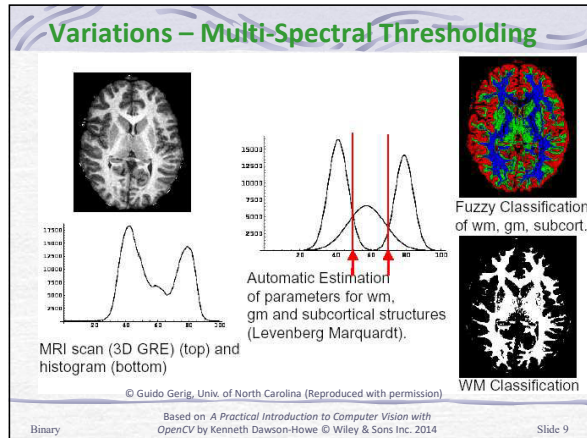

```
adaptiveThreshold( gray_image, binary_image, output_value,
                   ADAPTIVE_THRESH_MEAN_C, THRESH_BINARY,
                   block_size, offset );
```

Slide 8

8

9

Mathematical Morphology – Dilation

Minkowski set addition:

- $X \oplus B = \{ p \in \mathbb{E}^2; p = x+b, x \in X \text{ and } b \in B \}$
- B is the *structuring element*
- B is typically isotropic

Adds pixels around borders

Effects:

- Makes 'regions' bigger
- Fills small holes
- Joins close 'regions'

Based on A Practical Introduction to Computer Vision with OpenCV by Kenneth Dawson-Howe © Wiley & Sons Inc. 2014

Slide 11

11

Cleaning Binary Images

- Cannot use normal smoothing operations
- Need to remove noisy points and smooth binary region boundaries.
- Mostly we use operations originally defined as part of "mathematical morphology" (which treats images as sets).
- Most common operations:
 - Erosion
 - Dilation
 - Opening
 - Closing

Based on A Practical Introduction to Computer Vision with OpenCV by Kenneth Dawson-Howe © Wiley & Sons Inc. 2014

Slide 10

10

Mathematical Morphology – Erosion

Minkowski set subtraction:

- $X \ominus B = \{ p \in \mathbb{E}^2; p+b \in X \text{ for every } b \in B \}$
- Again B is typically isotropic

Removes border pixels

Effects:

- Makes 'regions' smaller
- Removes noise
- Removes narrow bridges

Based on A Practical Introduction to Computer Vision with OpenCV by Kenneth Dawson-Howe © Wiley & Sons Inc. 2014

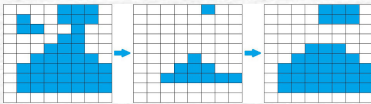

Slide 12

12

Mathematical Morphology –

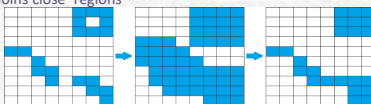

Opening: $X \circ D = (X \ominus D) \oplus D$

- Removes noise
- Removes narrow bridges
- Roughly maintains 'region' size
- Smooths shape

Closing: $X \bullet D = (X \oplus D) \ominus D$

- Fills small holes
- Joins close 'regions'
- Roughly maintains 'region' size

Slide 13

13

Mathematical Morphology – OpenCV Code

```
dilate( binary_image, dilated_image, Mat());
Mat structuring_element( 5, 5, CV_8U, Scalar(1) );
dilate( binary_image, dilated_image, structuring_element);

erode( binary_image, eroded_image, Mat());
Mat structuring_element( 5, 5, CV_8U, Scalar(1) );
erode( binary_image, eroded_image, structuring_element);

Mat five_by_five_element( 5, 5, CV_8U, Scalar(1) );
morphologyEx( binary_image, opened_image,
              MORPH_OPEN, five_by_five_element );
morphologyEx( binary_image, closed_image,
              MORPH_CLOSE, five_by_five_element );
```

Binary

Slide 15

15

Mathematical Morphology –

Opening:

- $X \circ D = (X \ominus D) \oplus D$

Closing:

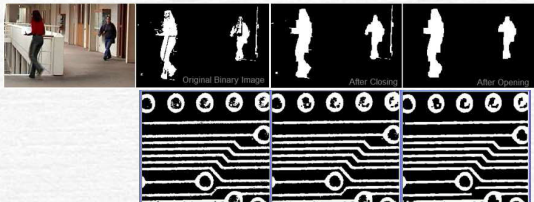

- $X \bullet D = (X \oplus D) \ominus D$

Isotropic structuring element:

- Eliminates small image details

Properties

- $X \circ D = (X \circ D) \circ D$ and $X \bullet D = (X \bullet D) \bullet D$

Slide 16

16

Mathematical Morphology – Local maxima

- Can be used to locate local maxima and minima

```
Mat dilated, thresholded_input, local_maxima, thresholded_8bit;  
dilate( input, dilated, Mat());  
compare( input, dilated, local_maxima, CMP_EQ );  
threshold( input, thresholded_input, threshold, 255,  
           THRESH_BINARY);  
thresholded_input.convertTo( thresholded_8bit, CV_8U );  
bitwise_and( local_maxima, thresholded_8bit, local_maxima );
```
